Engines

Container in HPC Workshop 101^e

Goal

What do we want to achieve?

- 1. Engines do the heavy (execution) lifting
- 2. They do lifecycle management of the
 - 1. Image
 - 2. Snapshot
 - 3. Container
- 3. on top they are doing configuration and setup to hand it over to (some) runtime. Sometimes the runtime is included or hidden.

Conclusion

What did we learn

- 1. Engine execute a container on a single node
- 2. HPC runtimes are build to duplicate the experience of a native process (mpirun sarus run —mpi)
- 3. Different from Enterprise Containers they do not start a service
- 4. Up until the Engine you should not worry to much about which runtime to use
