

Johanna Törnroos, CSC: Impact of Nordic e-Infrastructure Collaboration

Monday, 30 May 2022 13:45 (15 minutes)

The Nordic e-Infrastructure Collaboration (NeIC) as an organisation was established in 2012 as part of NordForsk with two roles. First was to operate the Nordic Tier-1 facility providing computing and storage for CERN to be used for research by high energy physicists worldwide. The second one was to facilitate e-infrastructure collaboration across the Nordic borders so that it could contribute to higher-level agendas and goals of the Nordic as well. Third role was assumed in 2019, to coordinate European projects. As a Nordic organisation, it is important for NeIC to demonstrate its value and map out the benefits it brings within and beyond the Nordic region. Each partner participating in NeIC projects expects to benefit from providing their staff and other resources to the projects. Each national funding agency expects NeIC to benefit the national research infrastructure strategies, enable excellent research and create impact at large. The Nordic Council of Ministers (NCM), which funds NeIC through NordForsk expects NeIC to create added value for the Nordic region.

This talk discusses how NeIC has responded to the expectations of its different stakeholders and created added value in the region.
